

Qenos June 2022 ACNCG update

Environmental performance

Qenos has not received any community complaints since the March ACNCG meeting. There was one elevated result to sewer from Resins reported to GWW from a March sample, see regulatory section below.

All environmental monitoring is proceeding according to schedules.

Safety Performance

There were no recordable injuries for employees and contractors to report. Contractors performed well over the last quarter which will result in a donation of \$6000 to a local charity who support the homeless.

Community interface

Qenos has been busy this last quarter working with a number of different local organisations providing donations or in kind assistance which has benefitted a broad and diverse community base.

- Hobsons Bay Arts Society 5x7 exhibition
- Hobsons Bay Wetlands Centre Open Day
- Hobsons Bay Community Fund Business Lunch
- Mount St Josephs Girls' College – Careers Expo
- Kororoit Creek Shared Trail Stage 4 - Risk Assessment work
- Qenos Charity Footy Day – Fight MND Fundraiser
- Winter also brings our continued partnerships with local football and soccer clubs

Regulatory interface

- EPA

There have been no issues to address since the March ACNCG meeting.

Qenos was issued an updated Environmental Action Notice to align with the new 2017 EP Act which came into force on 1st July 2021. This notice has the same scope as the original notice issued under the previous Act. The clean Up plan has been drafted and submitted to an EPA appointed Auditor for verification prior to submission to the EPA by the end of September due date.

- Greater Western Water

In response to the high decane result reported by Qenos to GWW from a March sample GWW completed follow tests and all parameters were in specification. No further action was required.

- Worksafe

Qenos submitted our safety case for 5 yearly renewal of MHF licence to Worksafe Victoria in May. Assessment of the submission and site verification process are underway for renewal of our MHF licence.

2022 EIP progress

The major project for the 2022 Environmental Improvement plan was to commission the project for the filter at the Effluent Treatment Plant. This was commissioned in April and initial testing has shown the carbon filter is very effective in removing hydrocarbons from the afterbay headspace. Results in May showed greater than 10 fold reduction in ppm readings.
